The Good, The Bad and The Ugly of Vertical Mixed-Use Development

We are in the beginning of a sea change with regard to how we live.
While low density, suburban development is by no means dead, more consumers want to live in walkable mixed-use areas that have a unique identity and sense of place.

Vertical mixed up developments are one way to help create walkable mixed-use areas with ground floor retail and other uses above.
- Communities that have or can create mixed-use walkable places will be at a competitive advantage over those that cannot.
- Opportunities to create walkable mixed-use areas will not be limited to our larger cities (although larger cities will have advantages over smaller cities in creating mixed-use living environments.)
Changing demographics and consumer preferences will fuel the growth of mixed-use areas.

There are 78 million baby boomers many of whom will have changing housing needs over the next decade.

The baby boomers will likely redefine what it means to get old and retire.
Baby Boomers
Baby Boomers

What we know is:

- They don’t need the large house in the suburbs
- They want maintenance free living
- They are a generation that has continually sought out what is new, different and vibrant
Echo Boomers

Behind the Baby Boomers are 73 million echo boomers born between 1977 and 1994.
Echo Boomers

A much higher percentage of this group is looking for urban, sustainable and walkable living environments.
So what does this mean for the FUTURE?
The Future

I predict that there will be a boom in “for sale” and “for lease” housing in mixed-use walkable areas within the next 7 years that will rival post war suburban development.
The Future

- In the near term, the residential housing component in mixed-use developments will mostly be rental product, but of much higher quality than typical suburban garden style apartment developments.

- Mixed-use developments will be significantly aided by local governments who see mixed-use walkable developments as a way to remain competitive.
The Future

Governments want:

- Ground floor retail
- Walkable
- Sustainable
- Vibrant

They see mixed-use as the way to get there.
So, what are the **lessons** we learned so far from the mixed-use projects we’ve done and the anticipated **trends**?
Lesson 1: Mixed-use works best in highly urbanized areas where the project (particularly the retail) can be woven into the fabric of an existing urban center. Mixed-use cannot survive without the density to support it.
Lessons

Lesson 2: A suburban mixed-use project (particularly the retail component) will flop absent a lot of things going right for it all at the same time.
Lesson 3: Suburban mixed-use development projects need to be of a sufficiently large scale to attract repeat customers and become a destination retail center.
Lesson 4: Suburban mixed-use development needs to have the sufficient population density to support the retail issues.
Lessons

Lesson 5: Suburban mixed-use development needs to be woven into existing areas of higher population density, older historic areas with character and areas where infrastructure investments by local government (parks, parking, road improvements, etc.) will help attract users.
Lesson 6: There is a difference between sustainable mixed-use and faux mixed-use. Too many cities want faux mixed-use to the detriment of sustainable mixed-use.
Lesson 7: Vibrancy can be created in ways other than ground floor retail.

- Alleyways
- Landscaping
- Outdoor seating
- Visible ground floor uses
- Public art
Trends

Suburban mixed-use has to either be a destination project or be in a destination area.

Themes of Success

Suburban mixed-use must create vibrancy and animation to survive. People have shorter attention spans than in the past. There are many ways to do this but the common components of success include...

Themes of Success

A safe and secure area

- A safe place to park
- Good lighting
- The presence of people day and night
- Police presence
Themes of Success

Sustainable uses people need as well as uses people want

- Doctor’s offices
- Dry cleaners
- Food stores
- Hardware stores
Challenges of Mixed-Use

Suburban mixed-use works best not as a stand alone project but integrated into smaller suburban downtowns with historical character and good public infrastructure.
Challenges of Mixed-Use

- Parking is and will remain the chief challenge of mixed-use developments
  - People want walkable spaces but they also still want their cars. Many mixed-use developments are places that people drive to and walk.
  - Constructing parking is frightfully expensive
    - Underground parking - $15,000-$25,000 per space
    - Pre-cast above-ground parking - $10,000-$15,000 per space
Challenges of Mixed-Use

- Future Parking Solutions
  - Timesharing cars
  - Building much smaller parking spaces
  - Timesharing spaces
  - Eliminating reserved parking
  - More realistic building code requirements
Challenges of Mixed-Use

- Wrapping buildings around pre-cast above-ground parking appears to be the solution of preference for now
  - Uses too much land
  - Destroys ability to create exciting, private spaces
Challenges of Mixed-Use

- More attention needs to be paid to sound, light and smell attenuation in the construction mixed-use developments
  - Wood frame construction as the transition between retail and residential simply does not work
  - The market is addressing through litigation what building codes have not yet addressed
Challenges of Mixed-Use

- Most vertical mixed-use developments are organized as complex master condominiums
Challenges of Mixed-Use

- This legal structure is largely used for two reasons:
  - A condominium is not a subdivision of real property
  - A condominium is the best way to describe real property of which is being divided both vertically and horizontally
Challenges of Mixed-Use

- Avoiding the subdivision of the property can normally increase the amount of permitted development on the property
Possible Set-Back Areas

**APARTMENT PARCEL 1**
- 25,000 sq. ft. of apartment
- 75,000 sq. ft. of commercial

**COMMERCIAL PARCEL 2**
- 75,000 sq. ft. of apartment
- 225,000 sq. ft. of commercial

**Total Site Entitlements:**
- 100,000 sq. ft. of Apartments
- 300,000 sq. ft. of Commercial
Total Site Entitlements: 100,000 sq. ft. of Apartments
300,000 sq. ft. of Commercial
Challenges of Mixed-Use

- If a Master Unit is submitted to a subcondominium regime, it can result in a condominium within a condominium.

Challenges of Mixed-Use

- In a typical vertical mixed-use development, we are seeing each owner wanting separate parking, separate lobbies, separate ingress and egress, separate elevators, separate utilities, separate common areas, etc.
  - It is almost as if we are subconsciously trying to separate and silo the very uses that were supposed to create vibrancy by being mixed together

There Are a Lot of Complicated Issues in the Operation of a Mixed-Use Development

- How do you best insure that every component has access to the portions of the mixed use development that they need to operate (i.e. service elevators, trash dumpsters, service delivery bays, life safety equipment, telecommunications equipment, electrical rooms, etc.) without having unlimited access to the entire development?

- How do you account for all of the building components serving one unit intruding into another unit (elevator shafts, plumbing and sewer system, HVAC systems, trash chutes, fireplace flues, structural supports)?
Mixed-Use

- Trend
  - More horizontal mixed-use rather than vertical mixed-use
  - More two-use buildings
    - Missed opportunity?
Mixed-Use

The downturn has made lenders realize that they don’t understand mixed-use or the legal structures on which they have been lending

- Declarant rights
- Architectural control
- Who may submit a phase
- How long they have to submit a phase
Mixed-Use

- We need to do a better job attracting families with children to mixed-use
  - Families with children are the missing cohort in mixed-use developments
    - Challenges of schools
    - Challenges of design
      - We are not designing for families with children
      - Should there be density bonuses for children friendly design
  - Opportunities for onsite daycare and supervision of children
